Electronics Corporation

SECURES FUEL AND CREDIT CARD READERS

DEFENDER ONE

PATENTED PROTECTION

Underwriters Laboratory Approved Kits

California Air Resource Board Accepted

No Monthly Fees

Addresses these Concerns:

- Credit Card Skimming
- Dispenser Vandalism
- Stolen Fuel
- Brand / Station Image
- Fuel Reconciliation
- Customer Safety

Defender One Advantages:

- Proven reliability and effectiveness
- Smart **in** dispenser controller
- Underwriters Laboratory Class1 Hazardous Safety Rating Approved
- Unlike the competition accidentally setting off the alarm **will not** electrically glitch your fuel or credit card equipment
- Robust installation with all locking connections

Missing fuel and credit card skimming are increasingly difficult challenges for operators in the retail fuel industry. The Defender One will help overcome the theft, vulnerabilities, and compliance challenges facing fueling stations today.

The Defender One is an electronic security system that monitors dispenser panels and doors to prevent entry.

Patented technology stops fuel flow at a breached dispenser.

Works with all POS systems.

Plug and play installation for most dispenser models.

Protection at the point of intrusion.

Internal battery maintains operation in the event of a power failure.

DEFENDER ONE

The Leader in Fuel Systems Security

If an intrusion is detected, a siren will sound and fuel flow will be stopped on both sides of that dispenser!

The 110db siren will turn off after a minute, but the dispenser remains disabled. The Defender One will continue with a softer alert until a trusted person has examined the dispenser and reset the alarm using a secure electronic key.

An exclusive PATENTED method of disabling the dispenser. When an intrusion is detected, both sides of the dispenser are disabled by the Defender One with no interruption of the dispenser power. Fuel cannot be dispensed on either side of the dispenser. **Unlike competitors no downtime or lost transactions** when doors are accidentally opened!

Unique design of our sensors and anchors.

The sensors have been specifically designed for use in a fuel dispenser and the metal anchors allow for fine tuning. They lock into place when panels are put on and doors closed.

Security at the point of intrusion.

Inside the dispenser the Defender One has one duty, to protect that pump. It does not rely on a process working somewhere else to shut down the pump. It eliminates human intervention better than any product on the market. It has been designed from the ground up to be the best fuel dispenser security on the market.

Each secure electronic key is unique, there are no two alike in the world.

A secure electronic key is the primary device used for disarming the Defender One. If security is breached by a lost key, the existing system can be re-programmed to accept a new secure electronic key. The key can also be used to perform a system test.

Monitoring Capabilities.

The Defender One has the ability to be connected to local or remote monitoring via a proprietary technology wireless signal. Text messaging, phone alerts and more are possible when an intrusion is detected.
